

**OUTLINE OF A COURSE ON
ELLIPTIC CURVES AND GROSS-ZAGIER THEOREMS
OVER FUNCTION FIELDS**

ARIZONA WINTER SCHOOL 2000

DOUGLAS ULMER

1. REVIEW OF ELLIPTIC CURVES OVER FUNCTION FIELDS

- Definitions and examples. Constant, isotrivial, and non-constant curves.
- The Mordell-Weil theorem.
- Constant curves. The lattices of Elkies, Shioda, et. al.
- Torsion is uniformly bounded. Ranks are unbounded.
- L -functions.
- Grothendieck's analysis of L -functions gives analytic continuation, functional equation.
- L -functions should be viewed as functions of characters of the idèle class group.
- Zarhin's theorem: $\chi \mapsto L(E, \chi)$ determines E up to isogeny.
- The conjecture of Birch and Swinnerton-Dyer.
- Work of Tate and Milne: $\text{ord}_{s=1} L(E, s) \geq \text{Rank}_{\mathbb{Z}} E(F)$ with equality if and only if \mathfrak{III} is finite.
- Outline of the proof:
 - The elliptic surface \mathcal{E}/\mathbf{F}_q corresponding to E/F .
 - $L(E, s) = \det(1 - q^{-s}\text{Fr}|H)$ for a certain $H \subseteq H^2(\bar{\mathcal{E}}, \mathbf{Q}_\ell)$
 - Points on E correspond to curves on \mathcal{E} . Heights are essentially intersection numbers.
 - Cycle classes of curves give rise to zeroes of the L -function.
 - Finiteness of $\mathfrak{III} \Leftrightarrow$ weak BSD comes from the Kummer sequence on \mathcal{E} and $\mathfrak{III} = Br$.
- Other work: Brown, Rück-Tipp, Longhi, Pàl.
- References: [Gross], [Zarhin], [Groth], [Milne80], [Tate66], [Milne75], [C-Z], Gross in [Storrs].

2. AUTOMORPHIC FORMS AND ANALYTIC MODULARITY

- Additive characters, multiplicative characters, conductors and real parts.
- Definition of $\mathcal{A}(K, \phi)$, automorphic forms of level K and central character ϕ .
- Analogue with functions on upper half plane. The double coset space X where automorphic forms live.
- X is the set of isomorphism classes of rank 2 vector bundles with level structure (up to twisting by a line bundle).
- Structure of X . (Riemann-Roch and stability.)
- Petersson inner product.
- Cusp forms.
- Hecke operators, new and old forms.
- Fourier expansions.
- L -functions.
- Functional equations.
- Harmonic forms.
- Constructions of forms, classically and in terms of vector bundles:
 - Eisenstein series
 - Poincaré series
 - Theta functions
 - Converse theorems
 - Deligne’s theorem: there is a form f such that $L(E, s) = L(f, s)$
 - Drinfeld’s geometric Langlands construction
- Interesting linear functionals on $\mathcal{A}(K, \phi)$ are represented as PIP with interesting forms $f \in \mathcal{A}(K, \phi)$.
- Half of the Gross-Zagier computation is to find the Fourier expansion of the form representing $f \mapsto L'_K(f, 1)$.
- References: [Weil], [Serre], [Gek], [Del], [Drin83].

3. DRINFELD MODULAR CURVES AND GEOMETRIC MODULARITY

- The ring A of functions regular outside ∞
- For k of characteristic p , $\text{End}_k(\mathbf{G}_a)$ is the twisted polynomial ring $k\{\tau\}$, $\tau a = a^p \tau$.
- Definition of Drinfeld modules. Rank, characteristic, height.
- Examples.
- Morphisms.
- Division points.
- Isogenies.
- Endomorphisms.
- Complex multiplication.
- Level structures.
- Modular curves.
- Analytic description of Drinfeld modular curves.
- The adelic version of the analytic description.
- The building map.
- Drinfeld reciprocity: relating the cohomology of the modular curve to automorphic forms.
- Geometric modularity via Drinfeld reciprocity, Deligne + converse theorems, and Zarhin.
- References: [Dri74], [D-H], [G-R], [AB], [Ohio].

4. OVERVIEW OF THE GROSS-ZAGIER COMPUTATION AND
APPLICATION TO ELLIPTIC CURVES

- Heegner points on $X_0(\mathfrak{n})$: existence, construction, Galois action. The Heegner point $P_K \in J_0(\mathfrak{n})(K)$.
- Goal: $L'_K(f, 1) = c \text{ht}(P_{K,f})$ (c a non-zero constant) for new eigenforms $f \in \mathcal{A}(\Gamma_0(\mathfrak{n}\infty), |\cdot|^{-2})$.
- Key reduction: do it for all f at once.
 - Let h_{an} be the form such that $(f, h_{an})_{PIP} = L'_K(f, 1)$.
 - Let h_{alg} be the form with Fourier coefficients $\langle P_K, T_{\mathfrak{m}} P_K \rangle_{ht}$.
 - A formal Hecke algebra argument shows that the goal is equivalent to the equality $h_{an} = c h_{ht}$. Prove this coefficient by coefficient.
- The analytic computation.
 - Rankin’s method shows that $L_K(f, s) = (f, h_s)_{PIP}$ where h_s is the product of a CM form (theta series) and an Eisenstein series which is a function of s .
 - Compute a trace to make the level of h_s $\mathfrak{n}\infty$.
 - Take the derivative at $s = 1$: $h = \frac{d}{ds} h|_{s=1}$.
 - Do a “harmonic projection”: find h_{an} harmonic such that $(f, h_{an})_{PIP} = (f, h)_{PIP}$ for all harmonic forms f .
- The algebraic computation
 - Interpret height as a sum of local intersection numbers.
 - At finite places, intersection number counts the number of isogenies between certain Drinfeld modules x, y over finite rings $\mathcal{O}_v/(\pi_v^n)$. (Use the moduli interpretation of points.)
 - Count these isogenies using the ideal theory of the quaternion ring $\text{End}(x)$.
 - At ∞ there is no convenient moduli interpretation. Compute the local height using a Green’s function, exactly as in the original G-Z. This is a very analytic way to calculate a rational number, but it meshes well with analytic aspects of the harmonic projection calculation.
- Application to elliptic curves. Show $\text{ord}_{s=1} L(E, s) \leq 1 \Rightarrow \text{BSD}$ for E/F by using G-Z formula and non-vanishing results for L -functions. In function field case, non-vanishing results are used for some useful preliminary reductions, and to find a good K/F .
- References: [G-Z].
